SWAY BAR LINKS BAD AGAIN?

THE SOLUTION!

MAXXLinks
• Replaces wear prone stock ball socket with a long-lasting, simple robust design
• Polyurethane bushings fit better and perform longer than original equipment
• Patented bushing design to allow articulation of the sway bar
• Extended lengths for Leveled and Lifted trucks/ SUVs
• Stainless steel washers and Grade 8 hardware
• 4140 heat treated steel end link
• No drill, direct bolt in
**FAQ and how to order links for your truck!**

**Q:** How do I measure my sway bar links on my lifted truck?

**A:** Measure the sway bar end link from the center line of the lower mounting point to the centerline of the upper mounting point. Our links are built to the specific center to center measurements.

**Q:** I have the center to center measurement but what part number do I need to order?

**A:** First select the link style you need based on your year make and model. Then add the desired measurement to the end of the part number.

For example if you need a 8-1/2” sway bar end link for your 2006 Dodge Ram 2500. The link style would be SMX-1226. The 8.5” version would be SMX-122685 or for a 8” version SMX-122680.

For sway bar links greater than 8.5” please call and we can build you a sway bar link for your RAM up to 12” Center to Center! Depending on your model.

Please verify the style of end link you need for your truck. Dodge has changed the sway bar links in some cases every two years and we have done our best to narrow the sway bar links down to the exact year make and model.

**Q:** I have a 4 inch lifted ram and it has stock end links, how could this be?

**A:** Lift kits often come with screw on extensions for your sway bar links or they use a drop bracket for the frame that allows you to keep the OE sway bar links.

**Q:** What about the Heim joint sway bar links?

**A:** We experienced and had customers try the heim joint style end links and at first they are great. As the heim joints wear over time they end up loose and noisy. No longer capable of keeping the sway bar firmly mounted to the axle.
END LINK TYPES

NO DRILL, DIRECT BOLT ON FIT
